Chapter 1

Introduction

Introduction template.

Chapter 2

Light Field Photography

The propagation of the light rays in the 3D space can be completely described by a 7D continuous function $R(\theta, \phi, \lambda, \tau, V_x, V_y, V_z)$, where (V_x, V_y, V_z) is a location in the 3D space, (θ, ϕ) are propagation angles, λ is the wavelength and τ the time; this function is known as the plenoptic function and describes the amount of light flowing in every direction through every point in space at any time, the magnitude of R is known as the radiance. In an 1846 lecture entitled "Thoughts on Ray Vibrations" Michael Faraday proposed for the first time that light could be interpreted as a field, inspired by his work on magnetic fields; but the idea of a plenoptic function representing the spectral radiance distribution of rays was first proposed by Adelson and Bergen [4].

FIGURE 2.1: Spatio-angular parametrization of the plenoptic function for fixed τ and λ . Figure taken from Wikipedia (https://en.wikipedia.org/wiki/Light_field)

In a more practical approach the plenoptic function can be simplified to a 4D version, called 4D Light Field or simply Light Field (abbreviated from now on as LF), denoted as the function L . The LF quantifies the intensity of static and monochromatic light rays propagating in half space, though this seems like an important reduction of information, this constraint does not substantially limit us in the accurate 3D description of the scene from where the light rays come from.

There exists three typical forms of this 4D approximation:

1. The LF rays positions are indexed by their Cartesian coordinates on two parallel planes, also called the two-plane parametrization $L(u, v, s, t)$.
2. The LF rays positions are indexed by their Cartesian coordinates on a plane and the directional angles leaving each point, $L(u, v, \phi, \theta)$.

3. Pairs of points on the surface of a sphere $L(\phi_1, \theta_1, \phi_2, \theta_2)$.

FIGURE 2.2: Three different representations of 4D LF. Left: $L(u, v, \phi, \theta)$. Center: $L(\phi_1, \theta_1, \phi_2, \theta_2)$. Right: $L(u, v, s, t)$. Figure taken from Wikipedia (https://en.wikipedia.org/wiki/Light_field)

In this work we will centered our attention in the two plane parametrization $L(u, v, s, t)$, if you are interested in the other descriptions we recommend to see [5]. In order to understand deeply this way of LF description, lets consider a camera with image plane coordinates (u, v) and the focal distance f moving along the (s, t) plane.

FIGURE 2.3: Graphic representation of the two plane parametrization of a single ray on the LF which is parametrized by the intersection (s, t) and (u, v) with planes π_0 and π_1 , respectively. Figure taken from [6]
p.21

For simplicity one can constrain the vertical camera motion by fixing $s = s_0$ and moving the camera along the t - axes in an straight light motion, in the section 2.2 we will see that this constraint leads to an elegant geometric 3D representation of the scene called Epipolar Geometry, this multiview aquisition is refered as parallax only (HPO). Under this constraint, images captured by successive camera positions t_1, t_2, \dots can be stacked together, and one can also interpret each camera position as a time step.

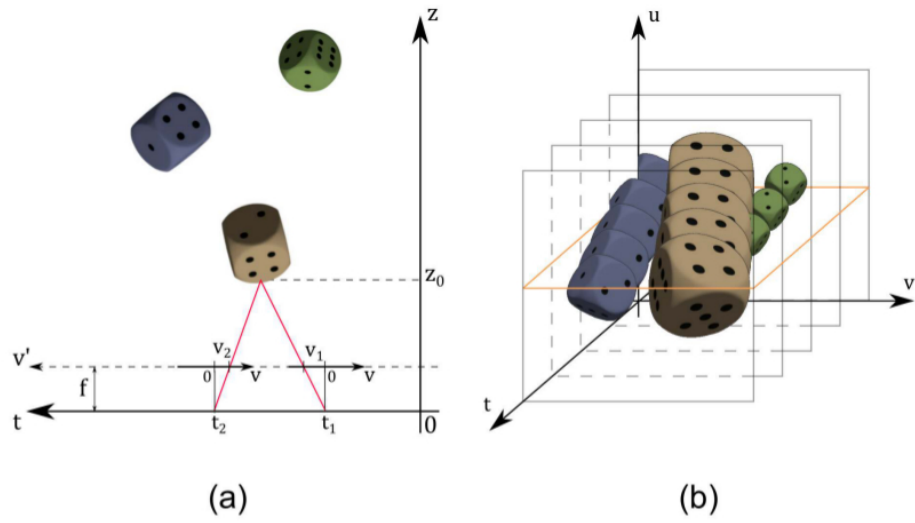

FIGURE 2.4: Stacked captured images represented in (b) from the scene setup (a). Figure taken from [3] p. 2

2.1 Light Field Photography in the History

2.2 Epipolar Geometry, Stereo Vision and Image rectification

2.3 Sparse acquisition of Epipolar-plane

2.4 Typical applications for the Light Field Theory

Chapter 3

Shearlets

Sample of Chapter 3

- 3.1 Shearlets as Frames**
- 3.2 Generalization of Shearlets to Alpha Particles**
- 3.3 Linear Shearlets and its relation with ridgelets**
- 3.4 Image inpainting using Shearlets**
- 3.5 Epipolar-plane representation with linear Shearlets**

Chapter 4

Inpainting Sparse Sampled Epipolar-plane

Sample of Chapter 4

- 4.1 Using linear Shearlets to inpaint sparse sampled Epipolar-plane
- 4.2 Iterative thresholding with constant velocity
- 4.3 Iterative thresholding with variable velocity

Chapter 5

Conclusion and outlook
